NOTE: The following is from my personal experiences while operating a small 7 bus charter company over a 17 year period. Back in 1983 when I was just beginning to operate a charter company I had a 1966 MC5A with a fresh majored 8V71 engine which was using 1 gallon of Delo® 100 oil every 2300 miles.

The Diesel engine (also known as a compression-ignition or CI engine), named after Rudolf Diesel, is an internal combustion engine in which ignition of the fuel, which is injected into the combustion chamber, is caused by the elevated temperature of the air in the cylinder due to the mechanical compression (adiabatic compression). Diesel engines work by compressing only the air.

Diesel engine - Wikipedia

Diesel engine: Diesel engine, any internal-combustion engine in which air is compressed to a sufficiently high temperature to ignite diesel fuel injected into the cylinder, where combustion and expansion actuate a piston. It converts the chemical energy in the fuel into mechanical energy, which is often used to power large vehicles.

A pressure-volume graph representation of a diesel engine operation is shown in Fig. 2, noting the key events in the cycle. This diagram, based on a real diesel engine, shows that modern diesels operate somewhat in-between an ideal Otto cycle (combustion and heat addition at constant volume), and the theoretical Diesel cycle (constant pressure combustion/heat addition).

I am sorry to say, but your assumption that the recycled exhaust gas increases engine temperature is completely incorrect. In fact it cools the engine down. when the engine is not under load the egr opens and carbon dioxide replaces some of the oxygen in the combustion chamber reducing the flame temperature and cooling the engine down. it also reduces the engine efficiency, but that is only ...
