Main Text Introduction. The computations taking place in the cerebral cortex depend on highly interconnected and dynamic microcircuits composed of two broad types of neurons: (1) glutamatergic excitatory neurons, or principal cells (PCs), which propagate signals within and among various stations, and (2) GABAergic inhibitory interneurons (INs), which gate signal flow and sculpt network dynamics.

The human nervous system consists of billions of neurons of various types and lengths relevant to their location in the body (Schalkoff, 1997). Fig. 1a shows a schematic of an oversimplified biological neuron with three major functional units — dendrites, cell body, and axon. The cell body has a nucleus that contains information about heredity traits, and a plasma that holds the molecular ...
